The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase that downregulates expression of a mitogen-activated protein kinase ((NAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or corganisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) conjugates and/or complexes of siNA; and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs containtritic, ancrectic, antibacterial, antirhelumator, antisathmatic, immunosuppressive, antibacterial, antirhelumator, antisathmatic, immunosuppressive, antibacterial, antirhelumator, containts and activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obseity, diabetes types I condition and validation; psociasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target containts, they can also be used for drug screening; diagnosis; target containts, and containts, pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide collantification and gene mapping (e.g. of single-nucleotide in the exemplification of the present invention.

New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of mitogen-activated diagnosis of cancer, oprotein kinase genes.

Example 3; SEQ ID NO 510; 164pp; English.

the present invention describes a short interfering nucleic acid (siNh) that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo corganisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) expression of siNA; and cells containing these vectors. MAPK siNAs have cytostatic, anorectic, antidabetic, antifiniammatory, antiarthritic, antipsoriatic and gastrointeserinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I and II; a wide range of tumours, and inflammatory diseases (asthma, eptic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; pharmacogenomics; cientification and validation; genetic engineering; pharmacogenomics;

New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of mitogen-activated protein kinase genes. Example 3; SEQ ID NO 519; 164pp; English.

The present invention describes a short interfering nucleic acid (sinA) that downregulates expression of a mitogen-activated protein kinase (whkpK) genes by RNA interference. Also described: (1) a method for modulating expression of MaPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of sinA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA and cells containing these vectors. MaPK siNAs have cytostatic, anorectic, antidiabetic, antiinflammatory, antiacthritic, antiposriatic and gastrointestinal activities. The MaPK siNAs siNAs can be used to modulate the expression of MAPK genes, in cells,

tissue explants or organisms, e.g. for treating obesity; diabetes types I and II; a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthrities, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK sinA which is used in the exemplification of the present invention. 88888888888888

Testis specific Helix Loop Helix proteins expressed in cancers and useful for the prevention, diagnosis and treatment of prostate, bladder and ovarian tumors.

Example 1; Page 31; 62pp; English

The present sequence is that of nested primer NP2, which was used in the amplification of gene fragments obtained from a suppression subtractive hybridization reaction using LAPC xenograft cDNA and designed to identify novel prostate and prostate cancer-specific genes. A 437 bp clone was obtained. Full-length cDNA (see AAS94275) was subsequently cloned from a transcription factor that is normally expressed only in testis cDNA there is up-regulated in prostate and other types of cancer. PTAN is expressed in 3 isoforms PTAN-1. 2, and 3. The PTAN gene is located on chromosome 1q22. PTAN is overexpressed in prostate cancer, and has a testis specific expression pattern in adult tissues PTAN shows no homology to any known gene. PTAN can be used in methods for the diagnosis of cancer, especially prostate or breast cancer, where the normal tissue samples are prostate tissue, or breast tissue, bone tissue, lymphatic tissue, serum, blood, or urine. A vector containing the PTAN nucleotide sequence, a vaccine composition targeting PTAN, PTAN treat cancer, especially breast and antisense sequences, can be used to treat cancer, especially breast and prisense sequences, can be used to treat cancer, especially breast and prisense sequences. Cancer development can be inhibited by a vaccine composition targeting PTAN
provides diagnostic and therapeutic methods useful in the management of various cancers which express PHELIX, including prostate cancer, bladder cancer, ovarian cancer and testicular cancer

BPC-1 polypeptides and polynucleotides can be used for the detection of BPC-1 polypeptides and polynucleotides in biological samples, this is particularly useful for detecting cancers expressing BPC-1, e.g. procestate cancer or bladder cancer. Antibodies directed against BPC-1 or antisense concer or bladder cancer for treating such cancers. The BPC-1 or antisense polymucleotides can also be used for treating sor inhibiting the careful and predicting susceptibility to developing cancer. The BPC-1 polypeptides and predicting susceptibility to developing cancer. The BPC-1 polypeptide and predicting susceptibility to developing cancer. The BPC-1 polypeptide comprises a cTDB domain which is expressed in prostate and bladder carcinoma cells and which shows sequence similarity with CTB domains from tissues of the brain, however, it is expressed at high levels in certain tissues of the brain, however, it is expressed at high levels in prostate cancer cells and bladder cancer cells. A number of synthetic colligonucleotides were used to generate BPC-1 cDNA from total cell RNA of tumour cells lines. These primars were a cDNA synthesis primer (AAZS3041), two adaptor sequences (AAZS3045), a PCR primer (AAZS3045) and two nested primers (AAZS3047, AAZS3048). This sequence is one of the nested primers (NP)1 used in the amplification method.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of nested primer NP2, used in a secondary PCK amplification of gene fragments generated by a suppression subtractive hybridisation protocol that was designed to identify genes which may be differentially expressed in human prostate cancer. A partial colone, termed 22P4F11 (see AA294894), was obtained and used to identify gene in normal tissues, and is also expressed in human prostate tumours, in some cases at high levels. The 22P4F11 is a testis-specific gene in normal tissues, and is also expressed in human prostate tumours, in some cases at high levels. The 22P4F11 transcript and/or protein (see AA79489) may represent a useful diagnostic marker and/or therapeutic target for prostate cancer. Methods of using 22P4F11 polynucleotides, polypeptides and antibodies for the diagnostis and treatment of cancers expressing 22P4F11, especially prostate cancer, are provided, as well as vaccines that prevent development of such cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel testes-specific gene 22P4F11 which is expressed in human prostate cancer and is useful as a diagnostic marker and/or therapeutic target for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      22P4F11; human; testis; prostate cancer; diagnosis; gene therapy; marker;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

PCR primers AAA14805-07 were used to amplify testis-specific protein Yencoded DNA. The specification describes a new method of diagnosis of prostate cancer. The method comprises determining the level of testis-specific protein Y-encoded (1987) mRNA or protein, and comparing these presence of elevated 1987 mRNA or protein is indicative of prostate cancer. Detection of TSPY mRNA expression or protein levels to be comparing the diagnosis of prostate cancer. Antisense polymucleotides complementary to the coding sequence of human TSPY are useful for treating prostate cancer by inhibiting TSPY transcription (when contacted with the TSPY also useful for treating prostate also useful for treating prostate cancer by inhibiting treating prostate cancer by cleaving the TSPY mRNA and therefore inhibiting its translation. The vaccine is useful for the inhibiting the development of prostate cancer in a patient
                                                                                                                                                                                                                                                                                                                                                    Diagnosing prostate cancer by determining the level of testis-specific protein Y-encoded (TSPY) mRNA or protein and comparing these TSPY mRNA or protein levels to those of a normal tissue sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps

The human 36PlA6 gene encodes a putative transcription factor based on homology to the murine EHF gene which encodes a transcription factor which is a member of the ETS family. 36PlA6 is expressed in androgen-dependent LAPC prostate cancer xenografts and in normal prostate at approximately equal levels. The highest expression is the the prostate and colon. 36PlA6 may be involved in activating tumor-promoting genes or repressing genes that block tumorigenesis. The 36PlA6 cancer, e.g. prostate, bladder, cervical, ovarian, pancreatic and colonic cancer (all claimed). Anti-36PlA6 antibodies may be used for purifying 36PlA6 and for isolating 36PlA6 antibodies may be used for purifying 36PlA6 and for isolating 36PlA6 antibodies may be used for oligonucleotides and ribozymes can be used to inhibit the transcription and translation of the 36PlA6 gene (Claimed). The 36PlA6 polymucleotides and immunogenic fragments may also be used in cancer and polypeptides and immunogenic fragments may also be used in cancer
                                                                                                                                                                                                                                                                                                                                                                                                           Novel putative transcription factor gene 36P1A6 for treatment, diagnosis and prevention of prostate, bladder, cervical, ovarian, pancreatic, and

30P3C8 polypeptide and polynucleotide used for diagnosing, treating and monitoring development of prostate cancer. WPI; 2000-619224/59

Example 1; Page 57; 99pp; English.

The present invention describes human prostate specific protein 30P3CB, which is over-expressed in prostate cancer cells. 30P3CB has cytostatic cativity and can be used in vaccines and gene therapy. Methods for activity and can be used in vaccines and gene therapy. Methods for cancering the levels of 30P3CB protein or mRNA in prostate tissue, bone tissue, lymphatic tissue, serum, blood or seemen are used for diagnoshing the presence of cancer in an individual or disregulated cell growth e.g. byperplasta. The cancers which are detected or diagnosed are of the bladder, pancreas, colon, brain, bone, lung, kidney or prostate by using test samples of serum, blood or urine or tissues of the bladder, compared or sequences can be used for treating cancers expressing colymucleotide sequences can be used for treating cancers expressing colymucleotide sequences can be used for treating cancers expressing colymucleotide sequences can be used for treating cancers app3CB are used in vaccines to inhibit the development of cancer. Anti-30P3CB concorded in the development of cancer. Anti-30P3CB concorded and other proteins e.g. receptors for which 30P3CB is a ligand.

30P3CB may be a growth factor or other molecule involved in tumour growth cancer prometing activities of 30P3CB. The assays are invasion or other cancer promocing activities of 30P3CB. The assays are used for detecting, staging and monitoring prostate cancer. The 30P3CB concert and provide a more specific assay than the serum prostate cancer and provide a more specific assay than the serum prostate concert and provide a more specific assay than the serum prostate concert and provide a more specific assay than the serum prostate concert and provide a more specific assay than the serum prostate concert which is used in the exemplification of the present invention.

The present invention provides the protein and coding sequences of human cancer related protein 20P2H8. The gene, which is found at chromosome 15q32-23, is upregulated in cancers such as that of the prostate, bladder, colon and pancreas. The sequences can be used to diagnose and treat these cancers, and to vaccinate against them. The present sequence is a PCR primer for the coding sequence of the invention

                                                                                                                              Novel 24P4C12 polypeptides and polynucleotides, used in the diagnosis and treatment of cancer, especially prostate cancer.
                                                                                                                                                                                                           The present invention describes a prostate tumour associated gene, designated 24P4C12, and its encoded protein. 24P4C12 has anticancer and cytostatic activity, and can be used in vaccine production and in gene therapy. A pharmaceutical composition or vaccine comprising 24P4C12 can be used to treat a patient with cancer, especially prostate cancer, the vaccine can also be used to inhibit the development or progression of cancer. The polypeptides and polynucleotides can be used to diagnose cancers, especially prostate cancer. A transgenic animal comprising 24P4C12 can be used for the development and screening of therapeutic reagents. The polypeptide is a transmembrane protein which is expressed specifically in prostate cancer, allowing the development of more specific anticancer therapies and diagnostic assays

treating c compounds.

```
The present invention relates to methods and compositions for the diagnosis and therapy of prostate cancer which utilise human SGP28 (specific granule protein 28) gene and proteins. The method involves centering cancers, particularly of prostate and colon, from cancers, particularly of prostate and colon, from coverexpression of SGP28 protein. The expression of SGP28, which is an coveracellular protein is restricted to the prostate and ovary, and is markedly up-regulated in prostate tumours. SGP28 sequence is used for diagnosis (including in vivo inaging), staging, monitoring and prognosis of prostatic and colon cancer, and for assisting salection of therapy. Composition or vaccine that contains a vector expressing an antibody specific for SGP28 protein, nucleic acid encoding SGP28 specific antibody specific for SGP28 protein, nucleic acid encoding SGP28 specific antibody optionally conjugated to toxin or therapeutic agent. SGP28 gene product is also used as source of therapeutic antisense or ribosyme agents, as primers/probes for diagnosis or prognosis, to identify compounds that inhibit calcium entry into prostatic cells, for recombinant production of SGP28 peptides and for isolating related sequences. SGP28 protein and its
                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, specific granule protein 28; SGP28; therapy; PCR primer; prostate; colon; cancer; prognosis; vaccine; anticancer; SSH; suppression subtractive hybridisation; ss.

fragments are used to raise specific antibodies (Ab) and to identify specific binding agents (potentially useful as therapeutic and diagnostic agents) and also potential anticancer agents. The present sequence is a nested primer 2 (NP2) used to amplify gene fragments resulting from SSH (suppression subtractive hybridisation) reaction. This sequence is used in the SSH isolation of cDNA fragment of human SGP28 gene 8888888888

Detecting presence of cancer expressing 36P6D5 protein in individual by comparing protein level in test sample to normal sample, where elevated level of protein in test sample indicates presence of cancer.

Example 1; Page 70; 113pp; English

The present invention relates to a gene and its encoded secreted tumour antigen, termed 36F0D5. These sequences are used for the diagnosis and treatment of various cancers which express 36F0D5, such as cancers of the kidney, bladder, ovary, breast, pancreas, colon and lungs. In normal individuals 36F0D5 protein, is predominantly expressed in pancreas, with comparising immunogenic protein of 36F0D5 is useful for inhibiting the development of prostate or colon cancer. Pharmaceutical composition comprising 3FF0D5 protein is useful for diagnosis and/or programs of prostate cancer and other cancers, for modulating or inhibiting the expression of 3FF0D5 genes and/or translation of the 3FF0D5 transcripts, and as therapeutic agents. The present sequence is a nested primer (NP)2 used to amplify gene fragments resulting from SSH (suppression subtractive hybridisation) reaction. This sequence is used in the SSH isolation of cDNA fragment of human 3FF0D5 gene

New PC-LECTIN polynucleotide encoding a transmembrane antigen over expressed in human prostate cancer, useful for the prognosis, diagnosis and treatment of prostate cancer.

Example 1; Page 59; 116pp; English

The invention relates to a novel human C-type lectin transmembrane cantigen, PC-LECTIN (AAB73309) and cDNA encoding it (AAF76004). The antigen, PC-LECTIN (AAB73309) and cDNA encoding it (AAF76004). The expression of the human PC-LECTIN gene is normally restricted to the capters of the human PC-LECTIN gene is normally restricted to the capters of the human PC-LECTIN and expression is therefore likely androgen-dependent prostate tumours. Gengard in the presente of androgen. Human PC-LECTIN therefore concer androgen-dependent prostate cancer. Human PC-LECTIN exhibits to particularly androgen-dependent prostate cancer. Human PC-LECTIN exhibits concerned to the normal particularly over a 265 residue overlap), but is not thought to be the human orthologue of layilin, as diverges significantly in a key functional domain proposed for the layilin concerned to protein. Human PC-LECTIN an immunogenic portion thereof, a vector protein. Human PC-LECTIN an immunogenic portion thereof, a vector concided-targetted ribozyme, or an anti-PC-LECTIN antibody may be used to prepare a composition for treating a patient with a cancer, concided-targetted ribozyme, or an anti-PC-LECTIN proteins are also useful for diagnosing the presence of cancer. PC-LECTIN antibodies and nucleotides are useful in the colon, pancreatic, testicular, expressing cancers. PC-LECTIN antibodies may also be used as drug targetting agents. The PC-LECTIN concludes and proteins may additionally be used in the isolation of human concerned sequence represents a pure primer used in the isolation of human concerned and proteins may additionally be used in the isolation of human concerned and proteins may additionally be used in the isolation of human concerned and proteins may additionally be used in the isolation of human concerned and proteins may additionally be used in the isolation of human concerned and proteins may additionally function or expression.

Novel gene designated PHOR-1, a G-protein-coupled receptor up-regulated in prostate cancer, useful as diagnostic marker and therapeutic target for cancers of prostate, kidney, uterus.

Example 1; Page 59; 139pp; English.

The invention relates to a novel G-protein-coupled receptor up-regulated in prostate cancer, termed PHOR-1. The encoding cDNA is contained in plantal designated plo10F2All deposited with ATCC as Accession No.PTA-112. PHOR-1 polypepides and polymuclectides are useful for diagnosing the presence of cancer, especially prostate, kidney, uterine, cervical, cancer parece by determining and comparing the level of the protein or mRNA expression in test and comparing the level of the protein or mRNA expression in test unsmall issue samples. Pharmaceutical compositions comprising PHOR-1 is useful for treating cancer. PHOR-1 proteins are useful for identifying ligands and other of generating antibodies which are useful in diagnostic, prognostic and for generating methodologies and for the treatment of prostate cancer. Cell insign methodologies and for the treatment of prostate cancer. Cell interactions mediated by PHOR-1 (The present sequence represents a primer useful in isolation of the PHOR-1 (prostate homologue of olfactory receptor

An isolated 83P5G4-related protein useful as a diagnostic and/or therapeutic agent in multiple cancers such as prostate, bladder and bone cancer

Example 1; Page 55; 112pp; English.

The nucleic acid sequences represent the 83P5G4 gene and the primers and adaptors used to amplify 83P5G4 DNA. 83P5G4 exhibits prostate specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, testis, bladder, kidney, brain, bone, cervix, uterus, ovary, breast, pancreas, stomach, rectum, liver, colon and lung. The 83P5G4 polynucleotide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polynucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an polynucleotide having the 83P5G4 capable of cleaving, a polynucleotide having the 83P5G4 capable of cleaving, a polynucleotide having the 83P5G4 cading sequence, are both; useful in the preparation of a composition for treating a patient with a cancer that expresses 83P5G4. The sequences can be used in diagnostic methods to monitor the level of 83P5G4 gene products in serum, blood, urine and tissue and to thereby detect the presence of cancerous cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences AAS42193-AAS42208 represent the 103P2D6 gene and the primers and adaptors used to amplify 103P2D6 DNA. 103P2D6 is not expressed in normal adult tissue but is aberrantly expressed in some forelal tissues contain and language to the prostate, testis, bladder, bone, cervix, ovary, breast, pancreas, colon and lung. The 103P2D6 DOPE, comprising a polymucleotide protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polymucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P2D6-related protein, antibody, that immunospecifically binds to an 103P2D6-related protein, and a ribozyme capable of cleaving a polymucleotide having the 103P2D6 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P2D6. The sequences can be used in diagnostic methods to monitor the level of 103P2D6 gene products in serum, blood, urine and tissue and to thereby detect the presence of cancerous cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, cytostatic, antiproliferative, vaccine, gene therapy,

the present sequence is nested primer (NP2) which is used to isolate the human six transmembrane epithelial antigen of the prostate (STEAP) cDNA fragment generated from suppression subtractive hybridisation (SSH).

STEAP gene is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP or inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP or inhibiting growth or killing cells expressing STEAP, or inhibiting growth or killing cells expressing that comprises the vector encoding single chain monoclonal antibody that comprises the variable domains of the heavy and light chains of the monoclonal antibody that specifically binds to STEAP, such that the vector delivers the single chain monoclonal antibody coding sequence to the cancer cells and the encoded single chain monoclonal antibody is expressed intracellularly
                                                                                                                                                                                                                                                                                                                                                     New STEAP (six transmembrane epithelial antigen of the prostate) proteins, expressed in human cancers, useful for detecting and treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           84P2A9; PCR primer; DNA adaptor; prostate; testis; tissue; cancer; 88; leukaemia; tunour; kidney; brain; bone; skin; ovary; breast; pancreas; colon; lung; cytostatic; gene therapy; antibody therapy; ribozyme; single chain monoclonal antibody; serum; blood; urine.

The nucleic acid sequences represent the 84P2A9 gene and the primers and adaptors used to amplify 84P2A9 DNA. 84P2A9 exhibits prostate and testis specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including leukaemia and tumours of the prostate, testis, kidney, brain, bone, skin, ovary, breast, pancreas, colon and lung. The 84P2A9 polymuclectide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polymucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 84P2A9-related protein, and a ribozyme capable of cleaving a polymucleotide having the 84P2A9 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 84P2A9. The sequences can be used in diagnostic methods to monitor the level of 84P2A9 gene products in serum, blood, urine and tissue and to thereby detect the presence of cancerous cells
                                                                                                                                                                                                                                                                          New 84P2A9 gene and its encoded protein, useful for diagnosing and treating cancer, e.g. leukemia and cancer of the prostate, testis, kidney, brain or bone, or for eliciting an immune response.
                                                                                                                                                         Levin E, Mitchell SC;

The present invention describes a method for monitoring 158P1H4 gene products in a biological sample from a patient who has or is suspected of products in a biological sample from a patient who has or is suspected of baving cancer. The method comprises determining the status of 158P1H4 gene products in a tissue sample from an individual, comparing the status of comparing the presence of aberrant 158P1H4 gene products in the sample. The status of 158P1H4 gene products in a normal sample, and comparing the presence of aberrant 158P1H4 sequences have cytostatic activity and can be used in vaccine production. 158P1H4 polymucleotides may be used in monitoring genetic abnormalities. The 158P1H4 proteins may be used in monitoring genetic comparing the malignant phenotype, in generating and characterising containing that bind to 158P1H4 or its particular domain, and for generating cancer vaccines. Antibodies against 158P1H4 are useful in diagnostic and products of the paticular domain, and for generating cytotoxic Tlymphocyte (CTL) or helper Tlymphocyte (HTL) responses, and simmunological respents for detecting 158P1H4 expressing cells. The antibodies are particularly useful in bladder cancer diagnostic and prognostic assays, and imaging methodologies. The 158P1H4 gene has been contended to chromosome 8q23, and the 158P1H4 gene has been contended to present invention has been located to chromosome 8q23, ABL60400 to ABL50429 and ABB95188 represent sequences used in the contendence of the present invention of the present invention

Novel isolated 55P4H4-related protein encoded by a gene over-expressed multiple cancers, useful as a diagnostic and/or therapeutic agent for cancer, preferably prostate cancer.

Example 1; Page 54; 160pp; English

This invention relates to an isolated 55P4H4-related protein encoded by a gene that is over-expressed in multiple cancers. The polypeptide is useful for inducing an immune response to an 55P4H protein, providing the protein comprises of at least one T cell or B cell epitope. The immune system cell is a B cell which generates antibodies that comprises of at least on T cell or B cell epitope. The specifically bind to the protein or is a T cell, preferably a cytotoxic T cell (TCI) which kills an autologous cell that expresses the 55P4H4 correction or a helper T cell (HTL) which secretes cytokines that correctioned which is considered useful for monitoring the presence of semilarationed which is considered useful for monitoring the presence of cancer in an individual, where the presence of elevated 55P4H4 mRNA or protein expression in the test sample relative to the normal tissue corrects in a prostate, kidney, testis, lung cervix, bone, bladder, brain or ovary tissue. The protein is useful in diagnostic assays that examine conductions associated with disregulated cell growth such as cancer and is also useful in forensic analysis of tissues of unknown origin, to treat a pathological condition characterized by the overexpression of 55P4H4 gene products in normal versus cancer use conduction assess the presence of perturbations in specific regions of the 55P4H4 gene. This sequence represents nested primer (NP) 2 used curing the method highlighted in the examples

```
The invention relates to a polymucleotide, designated 34F3D7, encoding a 34F3D7-related protein, comprising a sequence of 2198 nucleotides fully defined in the specification. The presence of elevated 34F3D7 mRNA or protein expression indicates the presence of cancer occurring in prostate, bladder, Kanbey, brain, bone, cervical, uterine, ovarian, brast, pancreatic, stomach, colon, rectal leukocytes, liver, and lung pirotein, an antisense polymucleotide complementary to 34F3D7 polymucleotide, or a ribozyme capable of cleaving the 34F3D7 polymucleotide, or a ribozyme capable of cleaving the 34F3D7 polymucleotide, is useful for inhibiting the development of a cancer example demonstrating suppression subtractive hybridisation (SSH)-generated isolation of a CNNA fragment of the 34F3D7 gene
                                                                                                               New gene designated 34P3D7, encoding a tissue-specific protein highly expressed in prostate cancer, for use as diagnostic and/or therapeutic target for cancers, and for eliciting an immune response.

New composition comprising a substance that modulates the status of 125P5C8 gene or a molecule that is modulated by 125P5C8, useful for treating or preventing cancer that expresses or over expresses 125P5C8.

Example 1; Page 68; 274pp; English

```
Sequences AAS95810-AAS95820 represent the 1039388 gene and the primers and adaptors used to amplify 103938 DNA. 1039388 exhibits tissue specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, bladder, kidney, colon, lung, breast, rectum and stomach. The 1039388 polynucleotide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polynucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 1039388-related protein, and a ribozyme capable of cleaving a polynucleotide having the 1039388 redains a persent with a cancer that expresses 1039388. The sequences can be used in diagnostic methods to monitor the level of 1039388 gene products in serum, blood, urine and tissue and to thereby detect the
The present invention relates to compositions comprising a substance that modulates the status of 125P5C8 or a molecule that is modulated by 125P5C8. The status of a cell that expresses 125P5C8 is modulated by composition is useful for treating cancer, particularly prostate, bladder, kidney, colon, ovary or breast cancer. The 125P5C8 protein and/or a nucleotide sequence encoding the protein is useful for immunising a mammal against cancer. The present sequence is a PCR primer shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          103P3E8; PCR primer; DNA adaptor; prostate; bladder; kidney; colon; lung; breast; rectum; stonach; tumour; cancer; cytoestatic; gene therapy; ss; antibody therapy; ribozyme; single chain monoclonal antibody; serum; blood; urine; tissue; human; chromosome 9q13-q21.

Example 1; Page 53; 155pp; English.

the invention relates to an isolated 98P7C3-related protein which is a homeodomain protein highly expressed in various cancers. Also include are polymuclectides encoding the protein or proteins 90% identical to 98P7C3, polymuclectides encoding the protein or proteins of identical to 98P7C3, an ancient of the protein comprising the polymuclectides (including an expression vector comprising the yestor, an anti-98P7C3 anti-body, an non-homen transformed with the vector, an anti-98P7C3 anti-body, an non-homen transformed with the vector, an anti-98P7C3 anti-body, an non-homen transformed with the vector, an anti-98P7C3 anti-body, an non-homen transform or polymuclectides in a biological sample, monitoring the 98P7C3 protein or polymuclectides in a biological sample, monitoring the presence of cancer in an individual by detecting an elevated level of the 98P7C3 protein or polymuclectides and a pharmaceutical composition comprising a modulator of 98P7C3. 98P7C3 protein, or T cell/B cell comprising the protein. Upon contact with a cytotoxic T cell (CTL) the immunogen may be a nucleic acid ancoding the protein or epitope. The anti-body is useful for delivering a cytotoxic agent to a cell that expresses 98P7C3, by conjugating the conjugate. The modulator is useful for the anti-body-agent to a cell that expresses 98P7C3, by conjugating the conjugate. The modulator is useful for treating a patient with a cancer

that expresses 98P7C3 (e.g. prostate cancer, bladder cancer, kidney cancer, lung cancer, breast cancer, uterine cancer, cervical cancer, estomach cancer, rectal cancer and colon cancer), by administering to the patient a victor that comprises the modulator, such that the vector delivers a single chain monoclonal antibody coding sequence to the cancer cells and the encoded single chain antibody is expressed intracellularly in it. The gene for 98P7C3 is located on human chromosome 4q11-q12. The present sequence is oligonucleotide adapter or PCR primer used to isolate a CDNA sequence. hybridisation, SSH

Monitoring 83P2H3 gene products for monitoring the presence of cancer is a subject, comprises determining the status of 83P2H3 gene products in tissue sample from the subject and comparing it to a normal sample. 

Example 1; Page 76; 270pp; English.

The invention relates to monitoring 83P2H3 (a calcium transport protein whose gene is located on chromosome 7q34) gene products in a biological sample from an patient who has or is suspected of having cancer cancer; captured of laving cancer cancer; captured in a tissue sample from an comparing the status of 83P2H3 gene products expressed by calls in a tissue sample from an product and (b) comparing the status to the status of 83P2H3 gene products in a normal sample. Also included are modulators of 83P2H3 gene products in a normal sample. Also included are modulators of 83P2H3 function or status, generating antibodies/immune response against 83P2H3 (or related protein Carrezzil whose gene is located on chromosome 12q24.1) using identified HIA (human leukocyte antigen) binding peptides derived from the protein, delivering a cytotoxic agent to a cell. Captured from the protein antigen-binding region of the antibody, a recombinant protein comprishing an antigen-binding region of the antibody, a non-human transgenic animal that produces the recombinant protein, a

thybridoma that produces the recombinant protein, a single- chain monoclonal antibody that comprises the variable domains of the heavy and monoclonal antibody that comprises the variable domains of the heavy and light chains of the anti-aPSPH3 antibody, a vector comprising a polynucleotide that encodes the monoclonal antibody and inducing an immune response to a 83PZH3 protein, by providing a 83PZH3-related protein that comprises a T cell or B cell epicope, and contacting the epitope with an immune system T cell or B cell, respectively. The method is useful for monitoring 83PZH3 gene products in a biological sample for compitoring the presence of cancer in an individual. The modulator is useful for inhibiting the growth of cancer cells that express 83PZH3. for treating an immune response against 83PZH3, and for detecting the cancer that expresses 83PZH3. The immunological methods are useful for generating an immune response against 83PZH3, and for detecting the presence of 83PZH3-related protein or polynucleotide in a biological sample from a patient who has or who is suspected of having cancer. The semicologies and treatment, to detect and quantify 83PZH3 and mutant methodologies and treatment, to detect and quantify 83PZH3 and mutant in solution is supported brotein. For itsolating 83PZH3 calated protein of cDNA encoding 83PZH3 or its

ö New compositions comprising a gene (designated 158P1D7), its encoded protein or their modulators, useful for treating or diagnosing cancers, particularly bladder cancer, in mammals (e.g. dogs, cats, cows, horses humans)

Example 1; Page 68; 181pp; English

The invention relates to a novel nucleic acid, designated 158PID7. The compositions are useful for treating or diagnosing cancers, particularly bladder cancer, in mammals (e.g. mice, rats, rabbits, dogs, cats, cows, horses or humans). The compositions are also useful for monitoring genetic abnormalities and in preparing cancer vaccines. The nucleic acid of the invention can be used in gene therapy to treat the said disorders. This polynucleotide sequence represents a PCR primer of the 158PID7 cDNA invention

Composition comprising a substance that modulates the status of a zinc transporter protein (108P5H8), useful in diagnosing and treating patients with cancer that express 108P5H8, such as breast, colon, ovarian or lung

Example 1; Page 95; 309pp; English.

The invention relates to a new composition comprising a substance that modulates the status of a zinc transporter protein, designated as 108P5H8, or a molecule that is modulated by 108P5H8. The composition is

useful in diagnosing, preventing, prognosticating or treating patients with cancer that expresses 108P5H8, such as breast, colon, ovarian or lung cancer. The 108P5H8 gene or its fragment can be used to elicit humoral or cellular immune response. The antibodises are useful in active or passive immunisation. The 108P5H8 polymucleotides are useful as probes and primers for the amplification or detection of 108P5H8 genes, as coding sequences for directing the expression of 108P5H8 polypeptides, or as tools for modulating or inhibiting the expression of 108P5H8 genes. The polymucleotides of the invention can be used to treat disorders by gene therapy. This polymucleotide sequence represents a zinc transporter protein 108P5H8 related PCR primer of the invention

New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal versus cancerous tissues.

Example 1; Page 70; 362pp; English.

The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polynucleotides are useful for eliciting humoral or cellular immune response. The polynucleotides are useful for characterising cytogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for

ABT43860 standard; DNA; 20 BP

generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies bor the antanagement of cancer. The present sequence represents an nested PCR primer used in the invention to amplify gene fragments resulting from suppression subtractive hybridisation (SSH) reactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a new composition comprising a substance that modulates the status of 158P3D2 or a molecule that is modulated by 158P3D2, where the status of a cell that expresses 158P3D2 is modulated. The composition is useful for treating cancer. This sequence represents novel protein 158P3D2 associated primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New composition comprising a substance that modulates the status of 158P3D2 or a molecule that is modulated by 158P3D2, useful for treating
                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to a novel composition comprising a substance that modulates the status of a 1519304 protein (e.g. 1519304 variant 1-11; or a molecule that is modulated by the 1519304 protein; where the status of a cell that expresses the 1519304 protein is modulated. The novel compositions, or the 1519304 protein and genes, are useful for eliciting a humoural or cellular immune response. The 1519304 genes and proteins are also useful for diagnosing, proventing preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This polynucleotide sequence represents a 1519304 related primer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New 151P3D4 proteins and genes, useful for eliciting a humoral or cellular immune response, or for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, lung, breast cancer

The invention relates to a novel composition comprising a substance that modulates the status of a 162P1B6 protein. The protein comprises one of 1 status of a 162P1B6 protein. The protein comprises one of 2 sequences of 70 - 146 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of a cell that expresses the protein is modulated. An antibody to the 162P1B6 protein is used to deliver a cytotoxic agent or a diagnostic agent to a cell that expresses the 162P1B6 protein. The composition is used to inhibit the growth of cancer cells or generate an immune response. The composition is used for detecting the presence of a 162P1B6 related protein or a 162P1B6 related polymucleotide in a sample. The 162P1B6 proteins and polymucleotides encoding them are useful for diagnosing, proteins or reating cancer, or breast cancer. They can also be used for eliciting a humoral or cellular immune response. The artibodies or T cells reactive with 162P1B6 are useful for active or passive immunisation. Transgenic animals are useful for developing and screening of useful reagents. The polymucleotide and polypeptide screening of the invention can also be used to treat disorders by being used in a vaccine or in gene therapy. This polymucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                           Composition for diagnosing, prognosing, preventing or treating cancer, for eliciting a humoral or cellular immune response, or for active or passive immunization, comprises a substance that modulates the status of a 162P1E6 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 STEAP-1; six transmembrane epithelial antigen of the prostate; cancer; cancer; cancer vaccine; delineation; cytogenetic abnormality; cytostatic;

The invention describes a composition comprising a substance that modulates the status of a protein (1) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polymucleotides and methods are useful for generating and electring cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polymucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This sequence represents a primer used to analyse human six transmembrane epithelial antigen of the prostate or STEAP-1 CDNA's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                             당
                                                                                                                                                                                                                                                                            STEAP-1-related protein, useful for treating and detecting cancer.
                                                                                                                                                                                                                                                             status

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful for probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a primer, used in an example from the invention
                                                              New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cancer associated coding sequence; cancer; human; cytostatic; gene therapy; PCR; primer; ss.

The present invention relates to a pharmaceutical composition comprising a substance that modulates the status of a cancer associated nucleic acid sequence such as given in the specification (see ABZ20564-ABZ20575) or a molecule that is modulated by the above nucleic acid sequence, where the status of a cell that expresses the nucleic acid sequence is modulated. The composition is useful in diagnosing, prognosing, preventing and/or treating cancer. The nucleic acid sequence may be used in monitoring antibodies, for identifying agents or cellular factors that bind to a protein, and in therapeutic and diagnostic contexts, such as diagnostic assays, cancer vaccines, and methods of preparing vaccines. The present sequence is a primer used to identify the cancer associated coding sequences suitable to be modulated in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises the amino acid and coding sequence of a 184PIE2 protein. The DNA and protein sequences of the invention are useful for diagnosing, prognosing, preventing and/or treating cancer. The 184PIE2 DNA and protein sequences may also be used to elicit a humoral or a cellular immune response in patients and in monitoring generic abnormalities. Antibodies raised against the 184PIE2 proteins may be use in active or passive immunisation. The present DNA sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New 184PIE2 polynuclectide encoding a 184PIE2 protein, useful for diagnosing, prognosing, preventing or treating cancer, in eliciting an immune response, and in chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                Gaps

This invention relates to a novel gene designated 205P1B5, and the encoded protein, which is aberrantly expressed in prostate cancer. Specifically, it refers to the two variants of 205P1B5 mapped to chromosome 821-8912, namely 205P1B4v1 and 205P1B5v2 and fragments thereof that serve as useful diagnostic, prophylactic, prognostic and/ or therapeutic targets for protate and other types of cancers. The present invention describes methods for the isolation of 205P1B5, for generating an immune response and for generating pransgenic or knock out animals for the development and screening of therapeutically useful reagents. Purthermore, it refers to identifying proteins, small molecules or other agents that interact with 205P1B5, and can be used to identify pathways activated by 205P1B5. Accordingly, these are cytostatic and immunogenic compositions that are useful for the development of cancer vaccines. This suppressive subtractive hybridisation (SSH) to isolate the 205P1B5 CDNA fragment of the invention.
                                                                                                                                                                                                                                                                                                                                                               205P1B5; prostate cancer; immune response; transgenic; knock out animal; cytostatic; immunogenic; vaccine; ss; SSH; suppressive subtractive hybridisation; PCR; primer; NP2.
                                                                                                                                                                                                                                                                                                                              Nested PCR primer 2 (NP2) used in SSH to isolate 205P1B5 cDNA fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotide designated 205P1B5, for diagnosing and treating prostate cancer, and as probes or primers for the amplification and/or detection of 205P1B5 genes.

The present invention describes a composition (I) comprising a substance that modulates the status of 121PIFI (gene and encoded protein), or a molecule that is modulated by 121PIFI (gene and encoded protein), or a molecule that is modulated. The human 121PIFI gene maps to chromosome 40. (I) has cytostatic activity, and can be used in gene therapy, and in vaccines. The composition (I) can be used for diagnosing, preventing, prognosticating or treating patients with cancer that expresses 121PIFI, such as breast, colon, ovarian or lung cancer. The 121PIFI gene or its cragment can be used to elicit a humoral or cellular immune response. I21PIFI antibodies can be used in active or passive immunisation. 121PIFI polymolecides are useful as probes and primers for the amplification or detection of 121PIFI genes, as coding sequences for the amplification or inhibiting the expression of 121PIFI genes. The present sequence is used in the exemplification of 121PIFI genes.

This invention relates to novel composition comprising a substance that modulates the status of a 433 residue protein, given in the specification with the DNA sequence encoding it, or a molecule that is modulated by the protein. The novel protein 193PEIB exhibits tissue specific expression in normal adult tissue and is aberrantly expressed in cartain cancers. Compositions which modulate the 193PIBIB protein may have cytostatic activity and the DNA sequence which encodes protein 193PIBIB may be useful in gene therapy. The composition of the invention may be useful por the treatment of cancer. The present sequence is that of an RT-PCR primer which was used for the amplification of human 193PIBIB gene DNA during the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Typing nucleic acid for obtaining information about several variable sites involves simultaneously or sequentially performing two or more primer extension reactions, and determining the pattern of nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Single nucleotide polymorphism; nucleic acid typing; tissue typing; human; PCR; primer; angiotensin converting enzyme; ACE; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel composition which comprises a substance that modulates the status of a novel protein (1612210B) and its variants having a sequence of 875 amino acids provided in the specification. The protein of the invention is over-expressed in certain cancers. The compounds of the invention may have cytostatic activity and the sequence of the 1612210B protein, and the gene which encodes it, may be useful for gene therapy or the development of a vaccine. The composition and methods of the invention are useful in diagnosing, preventing and useful careating ancier. The present sequence is that of PCR primer which was used for amplification of a region of the gene encoding the human 16122F10B protein during the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      193P1E1B; tissue specific expression; cancer; cytostatic; gene therapy; cancer; human; PCR; RT-PCR; reverse transcription PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A composition for diagnosing, preventing and treating cancer (e.g. prostatic, renal or uterine cancer) comprises 161P2F10B polynucleotides and polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                      Jakobovits A, Raitano AB, Faris M, Hubert RS, Ge W, Morrison KJM;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel method for obtaining typing information about several variable sites within target nucleic acid, or typing one or mote nucleic acid molecules. The methods of the invention are useful for typing one or more nucleic acid molecules containing two or more variable sites, preferably nucleic acid molecules containing three or more variable sites are typed, where three or more primer exension reactions or performed. The method is also useful for diagnosis of pathological conditions characterized by the presence of specific nucleic acid molecule(s). The method are particularly suited for identifying microbial species or their subtypes, and in typing procedures e.g. typing of polymorphisms, tissue typing or in clinical applications. The sequence cucleotide polymorphism (SNP) Euc from the angiotensin converting enzyme (ACE) gene. The primer binds to the template with its 3, end 5 cnucleotides from the SNP position

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleicide abse position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammtory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target cueful for treating rheumatoid arthritis, restenosis and asthma as well as in increasing observed to transplanted tissues. The procential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Arthritic condition, graft tolerance, immune response; target; cleavage; hammerhead ribozyme; hairpin ribozyme; human; rebbit; mouse; collagenase; stromelysin; synovial membrane; joint; arthritis; osteoarthritis; rheumatoid arthritis; autoimmune disease; allergy; inflammation;

  The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues 5 (i) at 2-C-allyl modification at position 4 of the ENA, (iii) at least to 1 i a 2-C-allyl modifications; and (iv) a 3-ead modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloaning of a donor. They can also be used for enhancing graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis Ribozyme therapy impacts on the expression of stromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                    Enzymatic nucleic acid molecules having a hammer-head motif - used for
the treatment of arthritis, induction of graft tolerance or treatment of
auto-immune diseases.

AAT49608-T49863 represent target sequences for the human cholesterol ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT49881-75017). CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme binds to 5 nucleotides either side of this site, provided the Sequence UH is immediately upstream. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby (HDL), prolonging HDL half life, and therefore increasing HDL levels. The ribozymes can be used to treat conditions associated with abnormal levels of CETP, specifically familial hypercholesterolaemia, atherosclerosis, peripheral vascular disease, hypercholesterolaemia, hypoalphalipoproteinaemia, dyslipidaemia, castenosis. By inhibiting CETP, the levels of HDL and low angioplastic restenosis. By inhibiting CETP, the levels of HDL and low chenty lipoproteins (LDP), and the HDL:LDL ratio are favourably altered density lipoproteins (LDP), and the HDL:LDL ratio are favourably altered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (a decrease in LDL levels, and a corresponding increase in HDL levels). The HH ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes target specific regions of the CETP gene, they have low non-
New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA -
useful for preventing or treating initial development, progression or
regression of vascular diseases, esp. familial hypercholesterolaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

AAT 49608-T49863 represent target sequences for the human cholesterol ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT49881-51017). CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme binds to 5 nucleotides either side of this site, provided the sequence UH is immediately upstream. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the synthhiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density lipoproteins (HDL), prolonging HDL half life, and therefore increasing HDL levels of CETP, specifically familial conditions associated with abnormal levels of CETP, specifically familial hypercholesterolaemia, atherosolerosis, peripheral vascular disease, hyperbetalipoproteins disease, transplant, atherectony and canging laterase in the HDL:LDL ratio are favourably altered angioplastic restenosis. By inhibiting CETP, the levels of HDL levels). The HH ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA, As the HH crears of the carbozymes target specific regions of the CETP gene, they have low non-specific and mutations to the CETP gene, they have low non-specific and contents. H New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial hypercholesterolaemia. functioning as promoters for the tetracycline resistance (TetR) gene.

functioning as promoters for the tetracycline resistance (TetR) gene.

They are derived from the -35 promoter sequence of the TetR gene of

plasmid pBR322. The sequences were produced to exemplify the invention.

The specification describes a method for obtaining an oligonucleotide

that confers a predetermined biological function, such as regulation of

expression or a biological activity of a polypeptide, on a cell. The

method comprises cloning a heterogeneous pool of oligonucleotides into an

expression vector, where the clones oligonucleotides are transcribed or

cat as regulatory sequences, introducing a random sample of the cloned

oligonucleotides into a population of cells that do not exhibit the

predetermined biological function, selecting a subpopulation of cells

exhibiting the predetermined biological function from the selected

subpopulation of cells. The process is used, for example, for identifying

new forms of the Escherichia coli tetracycline resistance gene promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identification of biologically active DNA sequences - by transforming cells with random oligo-nucleotide (s).
                                                                                                 -35 promoter; plasmid pBR322; tetracycline resistance gene; TetR; promoter; Escherichia coli; active site; beta-lactamase gene; ss.

Forward primer #43 used in multiplexing PCR/SBE assay.

Oligonucleotide array; genotyping; single base extension reaction; SBE;

```
The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to form the oligonucleotide array
                                                                                                                                                                                                                                                                                                                                                                        Universal array of oligonucleotides tags attached to a solid substrate along with locus-specific tagged oligonucleotides useful in genotyping using single base extension reactions.
                                                                                                                                                                                                                                                                                    Kaplan P, Lander ES, Lockhart DJ;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleoride, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, cinflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ubb, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ubt, pilaris, serborrhoea, keloids, keratosis, chthyosis, pityriasis, warts, benign growths, cancers of the skin, a hyperneovascular condition out the retina, brain or skin, growth factor-mediated malignancies, other sclerotic brain or skin, growth factor-mediated malignancies, other sclerotic brain or standard and propresent of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; sein discorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFB-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition; hyperplasia; kidney disease;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-like Growth Factor [167]-1 receptor, 1GF binding protein [1678]-2 or 1GFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, configuration and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotide which can be used to design the antisense oligomucleotide which can be useful for ameliorating the effects of psoriasis, chthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, chrain or skin, growth factor—mediated malignancies, other sclerotic disease, kidney disease, hyperplasia
                                                                                                                                                           Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 8; Page 90; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticomplete clede. (for Insulin-like Growth Factor IIGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation.

Inflammation and/or other disorders. Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 8; Page 62; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an

```
The invention relates to an isolated polynucleotide comprising a sequence which is a polymorphic variant of a reference sequence for crystallin, where the polymorphic variant comprises a CRYBB1 isogene defined by a haplotype from haplotypes 1-16 as given in the specification. Also included are a transgenic non-human animal transformed or transfected with the polymorphic variant, a computer system for storing and analysing polymorphism data for CRYBB1 isogenes, methods of determining an individuals haplotype or genotype as well as methods of determining the association of a particular haplotype with a disease or trait and a secondosition comprising at least one genotyping oligonucleotide
                receptor, 10F binding protein [16FBP] or 1GFBP3, which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense passent invention (see AAF45151 and AAF45153 - F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, planis, serbornhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperpoliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, crystallin beta B1, CRYBB1; chromosome 22q12.1; ophthalmalogical, cataract, allele specific oligonucleotide, ASO, ss; haplotype; genotyping; transgenic animal; PCR primer.

(especially allele-specific oligonucleotides (ASO)) for detecting a polymorphism in the CRYBB1. The isogenes or haplotypes are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with CRYBB1 activity, e.g. cataract. and can also be used by the pharmaceutical research scientist to validate CRYBB1 as candidate target for, and in design of clinical trials of candidate drugs for, irreating a specific condition drugs or disease predicted to be associated with CRYBB1 activity. The ASOs are useful as probes and primers, and for assaying a polymorphism in the target region. The present sequence is a pck primer which amplifies a region of CRYBB1 containing one of 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting a base at a pre-determined position in a nucleic acid molecule, comprises performing primer extension reactions using base-specific detection primers in the presence of a nucleotide-degrading enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for detecting a base at a predetermined position in a nucleic acid molecule. The method comprises performing primer extension reactions using base-specific detection primers, each being specific for a particular base at the predetermined position. The allele-specific (AS) primer extension assay method of the invention is useful for detecting an allele-specific base at a predetermined position in a nucleic acid molecule, for high throughput single nucleotide polymorphism (SNP) analysis, and for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, allele-specific base detection; primer extension reaction; base-specific detection primer, allele-specific primer extension assay; AS; high throughput; single mucleotide polymorphism; SNP analysis; mutation detection; genetic variation; allele-specific extension; probe;

The present invention relates to a novel method of producing a stabilised double D loop at a target sequence within a double-stranded nucleic acid. The method involves contacting the double-stranded nucleic acid with an oligonuclectide having a first and second strand with at least a region of complementarity in between them. The first oligonuclectide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not bound. The methods, oligonuclectides, compositions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic acid target sequence is an annealing oligonuclectide for Kan- target. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Producing a stabilized double D loop at a target sequence within a double stranded nucleic acid comprises contacting the nucleic acid with an oligonucleotide having a first and second strands with a region of
mutations and genetic variations. The new method solves the deficiencies of previous methods by providing a method of allele-specific extension that allows accurate discrimination between marched and mismarched configurations, as well as reducing or eliminating false positive results observed in prior art. The use of two allele-specific primers increases the sensitivity by a factor of two because signals of two extensions are obtained. The present sequence represents a probe used in the examples of
                                                                                                                                                                                                                                    Gaps

The present invention relates to a novel method of producing a stabilised double D loop at a target sequence within a double-stranded nucleic acid. The method involves contacting the double-stranded nucleic acid with an oligonucleotide having a first and second strand with at least a region of complementarity in between them. The first oligonucleotide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not obound. The methods, oligonucleotides, compositions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic acid target sequences. The present sequence is an oligonucleotide which is used for determination of optimal oligonucleotide composition for the invention

The present invention relates to a novel method of producing a stabilised double D loop at a target sequence within a double-stranded nucleic acid. The method involves contacting the double-stranded nucleic acid with an oligonuclectide having a first and second strand with at least a region of complementarity in between them. The first oligonuclectide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not bound. The methods, oligonuclectides, compositions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic acid target sequences. The present sequence is a locked nucleic acid (INA) which is used as an annealing oligonuclectide for Kan- target. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           producing a stabilized double D loop at a target sequence within a double stranded nucleic acid comprises contacting the nucleic acid with an oligonuclectide having a first and second strands with a region of complementarity in between.
                                                                                                                                                                                    Detection; purification; double D-loop formation; locked nucleic acid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               double D loop at a target sequence within a double-stranded nucleic acid.

The method involves contacting the double-stranded nucleic acid with an oligonucleotide having a first and second strand with at least a region of complementarity in between them. The first oligonucleotide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not bound. The methods, oligonucleotides, compositions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic generate neomycin phosphorransferase mutant (Kan-) gene. This sequence is used in the exemplification of the invention
                                                                                   ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing a stabilized double D loop at a target sequence within a double stranded nucleic acid comprises contacting the nucleic acid with an oligonucleotide having a first and second strands with a region of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a novel method of producing a stabilised double D loop at a target semience within a double D loop at a target semience within a double.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      double D-loop formation; neomycin phosphotransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present invention relates to a novel method of producing a stabilised double D loop at a target sequence within a double-stranded nucleic acid. The method involves contacting the double-stranded nucleic acid with an oligonucleotide having a first and second strand with at least a region of complementarity in between them. The first oligonucleotide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not bound. The methods, oligonucleotides, compositions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic acid target sequences. The present sequence is an oligonucleotide which is used for double D-loop formation. This sequence is used in the
                                                                                                                                                                                                                                 Producing a stabilized double D loop at a target sequence within a double stranded nucleic acid comprises contacting the nucleic acid with an oligonuclectide having a first and second strands with a region of complementarity in between.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid, hammerthead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; anti-HCV; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a novel method of producing a stabilised double D loop at a target sequence within a double-stranded nucleic acid. The method involves contacting the double-stranded nucleic acid with an oligonuclectide having a first and second strand with at least a region of complementarity in between them. The first oligonuclectide strand has a region that is complementary to a first strand of the target and binds to the recombinase while the second strand is not bound. The methods, oligonuclectides, compositions and kits are useful for detecting and purifying known nucleic acid targets and for manipulating defined nucleic acid target sequences. The present sequence is an annealing oligonuclectide for Kan- target. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Producing a stabilized double D loop at a target sequence within a double stranded nucleic acid comprises contacting the nucleic acid with an oligonucleotide having a first and second strands with a region of complementarity in between.

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, DNAzymes, are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptuse primer sequences, as well as oligonucleotides that specifically bind the Bnhancer I region of HBV genes and dor HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the carcinoma. The present sequence represents a substrate for one of the carcinoma. The present sequence acid sequences disclosed in the present
                                                                                                                                                                                                                                                                             Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                           Mcswiggen J, Morrissey D, Pavco P, Lee P;

infection.

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HRV) RNY. The nucleic acid molecules include antisense and enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, an eargmatic nucleic acids such as harmerhead ribozymes, DNAzymes, and enzymatic nucleic acid decoy molecules and G-cleaver ribozymes, Also disclosed are uncleic acid decoy molecules and G-cleaver ribozymes, Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and chose the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and generations are useful. For the treatment of degenerative and captement as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represence a target for one of the anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Microarray; probe; Mycobacterium; antibiotic-resistance; genotyping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

```
The present sequence is that of kan klo3, an oligonucleotide mismatched (non-hybridising) to the triplet repeat region of exon 1 of the human Huntington's disease (HD) gene. The oligonucleotide is modified by including locked nucleic acid (InA) residues at both ends. Administration of this short, modified oligonucleotide to neuronal PC12 cells bearing an HD exon 1-GFP fusion gene did not result in a decrease in Huntington protein (huntingtin) aggregation in cell culture studies. The invention realases to oligonucleotides, including oligonucleotides containing IMA modifications, that alter the genomic HD gene sequence and/or reduce the propensity of huntingtin to form intracellular aggregates. These can be used for the treatment or prevention of HD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New single stranded oligonucleotides comprising a DNA domain having at least one mismatch with respect to the genetic sequence of the Huntington's disease gene to be altered, useful for treating or preventing Huntington's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2.9%; Score 12.4; DB 1; Length 15; 92.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a microarray comprising a support, a first probe for genotyping Mycobacterium species, second probe for differentiating Mycobacterium thebroulosis strains, and a third probe for detecting antibiotic-resistant strains, where the probes are immobilized on the support. This sequence represents an example of the first probe used for genotyping Mycobacterium species. The array is useful for simultaneously genotyping Mycobacterium species, differentiating M. tuberculosis strains and detecting antibiotic-resistant strains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                   Microarray for simultanecusly genotyping Mycobacteria species, differentiating Mycobacterium tuberculosis strains and detecting antibiotic-resistant strains, comprises specific probes on a support.

                                                                                                                                                                                                                                                                                                                The present sequence is that of kan klo1, an oligonuclectide mismatched (non-hybridising) to the triplet repeat region of exon 1 of the human lumining on's disease (HD) gene. The oligonuclectide is modified by having locked nucleic acid (LNA) residues throughout its length. Administration of this short, modified oligonuclectide to neuronal PC12 cells bearing an protein (huntingtin) aggregation in cell culture studies. The invention relates to oligonuclectides, including oligonuclectides containing LNA modifications, that alter the genomic HD gene sequence and/or reduce the propensity of huntingtin to form intracellular aggregates. These can be used for the treatment or prevention of HD
                                                                                                                                                                                                         New single stranded oligonucleotides comprising a DNA domain having at least one mismatch with respect to the genetic sequence of the Huntington's disease gene to be altered, useful for treating or preventing Huntington's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 20-FEB-2003.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ABZ81742;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 618
ABZ81742/c
```

```
The present sequence is that of single-stranded oligonucleotide Kan MuR/1SG, which has 2'0-Me modifications throughout its length.

Administration of this oligonucleotide to PCI2 neuronal cells containing an engineered Huntington's disease (HD) gene exon 1 including alternating, repeating Gln codons (CAA/G) had little effect on HD protein (huntingtin) aggregation. This was in contrast to other modified oligonucleotides (see ABZB173'-39) which, although non-specific and non-hybridising to the HD gene, and being incapable of directing sequence hybridising of the tripler repeat region of exon 1, nevertheless reduced the formation of HD protein aggregates. Such oligonucleotides can be used for the treatment or prevention of HD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to distinguishing presence of a nonsupercoiled target nonsupercoiled target
                                                                                      New single stranded oligonucleotides comprising a DNA domain having at least one mismatch with respect to the genetic sequence of the Huntington a disease gene to be altered, useful for treating or preventing Huntington's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Distinguishing nonsupercoiled target nucleic acid in sample of nucleic acids from variants of the target, by forming deproteinization-stable double D loops in target query region which distinguish target from

       ਨੇ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                      The present sequence is that of single-stranded phosphorothioate oligonucleotide Kan ub77/15G. Administration of this oligonucleotide to oligonucleotide college containing an engineered Huntington's disease (HD) gene exon including alternating, repeating Gln codons (CAA/G) resulted in a reduction in the formation of HD protein (huntingtin). Kan ub77/15G is an example of modified oligonucleotides of the invention, which, although non-specific and non-hybridising to the HD gene, and incapable of directing sequence alternation of the triplet repeat region of exon 1, nevertheless reduce the formation of HD protein aggregates. Such oligonucleotides can be used for the treatment or prevention of HD
                                                                                                                                                                        New single stranded oligonucleotides comprising a DNA domain having at least one mismatch with respect to the genetic sequence of the Huntington's disease gene to be altered, useful for treating or preventing Huntington's disease.

Distinguishing nonsupercoiled target nucleic acid in sample of nucleic acids from variants of the target, by forming deproteinization-stable double D loops in target query region which distinguish target from

Example 10; SEQ ID NO 38; 179pp; English.

The present invention relates to distinguishing presence of a nonsupercoiled target nucleic acid from presence of nonsupercoiled target variants within a sample of nucleic acids, the variants differing from target by a nucleotide within a common target query region (TQR), involving using a recombinase to mediate formation of deproteinization-

ctable double D loop in TQR and then distinguishing degree of formation of double D loops that are stable to deproteinization. The method is useful for distinguishing the presence of a monsupercolled target mucleic acid such as a linear duplex DNA, covalently closed circle, or artificial chromosome from the presence of nonsupercolled target variants within a sample of mucleic acids and is also useful for targets within the sample of nucleic acids and is also useful for separating a nonsupercolled double- stranded nucleic acids within a sample of nucleic acids within a larget of nucleic acids within a sample of nucleic acids within a sample of succeed within a separating a large number of loci to be screened within a single sample, may be adapted to a variety of existing detection systems, and permit target amplification without PCR, increasing fidelity. The ability to separate desired double stranded targets with allelic selectivity, with or without contemporaneous detection, offers sequence is an oligonucleotide of the invention.

Distinguishing nonsupercoiled target nucleic acid in sample of nucleic acids from variants of the target, by forming deproteinization-stable double D loops in target query region which distinguish target from variant.

Example 2; SEQ ID NO 5; 179pp; English.

The present invention relates to distinguishing presence of a nonsupercoiled target nucleic acid from presence of nonsupercoiled target variants within a sample of nucleic acids, the variants differing from target by a nucleotide within a common target query region (TQR), involving using a recombinase to mediate formation of deproteinization-stable double D loop in TQR and then distinguishing degree of formation of double D loops that are stable to deproteinization. The method is useful for distinguishing the presence of a nonsupercoiled target nucleic

```
acid such as a linear duplex DNA, covalently closed circle, or artificial chromosome from the presence of nonsupercoiled target variants within a sample of nucleic acids. The method distinguishes several nonsupercoiled targets within the sample of nucleic acids and is also useful for separating a nonsupercoiled double- stranded nucleic acid target from other nonsupercoiled double- stranded nucleic acid target from where 10-10000 fold purification is effected. The methods are readily where 10-10000 fold purification is effected. The methods are readily single sample, may be adapted to a variety of existing detection systems, and permit target amplification without PCR, increasing fidelity. The selectivity, with or without contemporaneous detection, offers significant advantages over current genotyping methods. The present sequence is an oligonucleotide of the invention.

The present invention relates to distinguishing presence of a nonsupercoiled target nucleic acid from presence of nonsupercoiled target nucleic acids the variants differing from target by a nucleotide within a sample of nucleic acids, the variants differing from target by a nucleotide within a common target query region (TQR), involving using a recombinase to mediate formation of deproteinization. It compared to be a common target guery region (TQR), involving using a recombinase to mediate formation of deproteinization. The method is useful for distinguishing the presence of a nonsupercoiled target nucleic acids such as a linear duplex DNA, covalently closed circle, or artificial chromosome from the presence of nonsupercoiled target variants within a sample of nucleic acids. The method distinguishes several nonsupercoiled targets within the sample of nucleic acids and is also useful for separating a nonsupercoiled double- stranded nucleic acid target from other nonsupercoiled nucleic acids within a sample of nucleic acids, where 10-1000 fold purification is effected. The methods are readily multiplexed, permitting a large number of loss screened within a construction and an arriver.
where 10-10000 fold purification is effected. The methods are readily multiplexed, permitting a large number of loci to be screened within a single sample, may be adapted to a variety of existing detection systems, and permit target amplification without PCR, increasing fidelity. The ability to separate desired double stranded targets with allelic selectivity, with or without contemporaneous detection, offers significant advantages over current genotyping methods. The present sequence is an oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       single sample, may be adapted to a variety of existing detection systems

The invention relates to a novel method for amplifying a DNA using polymerase chain reaction (PCR) comprising synthesising the first region of a base sequence to be amplified by designing a pair of primers so as to place the first region between them and to anneal each other at the 3-end and carrying out a polymerase chain reaction (PCR) using the primers. Subsequently, the second region is synthesised by designing a pair of primers so as to place the second region partly overlapping with the first region of the base sequence between them and to anneal each other at the 3'-end and carrying out a PCR using the primers. Pinally, the first region is annealed to the second region generating the template to carry out a PCR and thus to synthesize a base sequence containing the first and the second regions. The method of the invention may be useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Amplification of a DNA, a gene encoding the repeated sequence of an amino

                                                                                                                                                                                        Gaps
and permit target amplification without PCR, increasing fidelity. The ability to separate desired double stranded targets with allelic selectivity, with or without contemporaneous detection, offers significant advantages over current genotyping methods. The present sequence is an oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The inventors claim an oligo-peptide-carrier conjugate in which the three moieties are covalently linked to one another. The peptide provides a cleavable linker which is cleaved by enzymes which do not degrade antisense oligos (ODNS). The ODN-Largeting ligand linkage must be stable to serum proteases, yet cleaved by the lyosomal enzymes in the target coll. The method involves conjugation of an ODN bearing an electrophilic crosslinking gp. to a peptide which bears two mucleophilic gps of that a nucleophilic handle remains on the peptide. This gp. is used to turther attach the lyosomotropic carrier to the peptide portion of the ODN-peptide conjugate. The peptide is therefore aslo used as a heterobifunctional linker. Two different model ODNs were used - ODNI and CODN-peptide is therefore aslo used as a heterobifunctional linker. Two different model ODNs were used - ODNI and transcript for the Hepatlits B surface antigen in Hep3B cells. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New covalently linked conjugates of oligo:nucleotide, peptide and carrier - utilising surfactant, poly:amine or targetting ligand as lyso somotropic drug carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR; primer; amplification; promoter; graminaceous plant; rice; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is a ACE mRNA target sequence (nucleotide no. 1771) of an enzymatic RNA molecule (ribozyme) which cleaves mRNA associated with the development or maintenance of a cardiovascular condition. The concn. of the ribozyme necessary to effect a therapeutic treatment is lower than that of an antisense oligomocleotide and the specificity of action is higher. (Updated on 25-WAR-2003 to correct PN field.)

This is the nucleotide sequence of a PCR primer used in the amplification of the Rice tungro bacilliform virus (RTBV) promoter. The isolated genome-length transcript promoter from RTBV is used for driving gene expression in the vascular bundles of graminaceous plants, especially rice, especially where the gene encodes a protein conferring a desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polynucleotides encoding full-length polypeptides, e.g. secretory and/or membrane proteins, useful for developing medicines for diseases in

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A partent (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (ft-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (ftk-1) (e.g. tumour angiogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX7575 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; trumour anglogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                               present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecule modulating VEGF receptor(s) gene expression or stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                             Gaps
which the gene is involved, or as target molecules for gene therapy
                                                                    The present invention relates to novel human secretory or membrane proteins (ADA54072-ADA55710) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalies of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease. The prequence was used in an example from the invention.
                                                                                                                                                                                                                                                                             ö

Detecting nucleic acids for the diagnosis of heritable genetic disorders and for the detection of microbial organisms in food and biological

Example 7; Page 25; 74pp; English.

This invention describes a novel method (I) for detecting nucleic acids using novel primers and an integrated signaling system. (I) may be used for the detection of variations genomic DNA samples (e.g. from humans, animals and plants). It is particularly useful for detecting inherited diseases (by detecting abnormalities in DNA from patients) and microbial infections (e.g. human immundeficiency virus (HIV) and Hepatitis C infections (e.g. human immundeficiency virus (HIV) and Hepatitis C infections (or bacterial infections of food). (I) provides high levels of sequence specificity, detection sensitivity and high rates of signal applicity and allowing enhanced specificity based on the ready availability of a target binding region (TargBR) for hybridization with product is the target binding region (TargBR) for hybridization with product is the target species so the output signal obtained is directly related to the amount of extended primer. (I) is not dependent on additional hybridization events or ensymmatic steps intra- and inter-strand competition for the probe site is limited so the probe design is simplified and probes which fail to bind under standard assay conditions in spearate probe formats may function in (I). Additionally, homogenous assay formats may be derived from (I). Finally, as the interaction is cycling rates. AAZ24184-Z24190 represent primers used in the method of the propertion.

the invention

```
This invention describes a novel method (I) for detecting nucleic acids using novel primers and an integrated signaling system. (I) may be used using novel primers and an integrated signaling system. (I) may be used an impact of variations genomic DNA samples (e.g. from humans, and plants). It is particularly useful for detecting inherited diseases (by detecting abnormalities in DNA from patients) and microbial infections (e.g. human immunodeficiency virus (HIV) and Hepatitis C infections (e.g. human immunodeficiency virus (HIV) and Hepatitis C viruses or bacterial infections of food). (I) provides high levels of sequence specificity, detection sensitivity and high rates of signal applicity and allowing enhanced specificity based on the ready aniphlicity and allowing enhanced specificity based on the ready aniphlicity and allowing region (TargBR) for hybridization with product is the target binding region (TargBR) for hybridization with product is the target species so the output signal obtained is directly related to the amount of extended primer. (I) is not dependent on product is the target species of the output signal obtained is directly related to the amount of extended primer. (I) is not dependent on strand competition for the probe site is limited so the probe design is simplified and probes which fail to bind under standard assay conditions in spearate probe formats may be derived from (I). Finally, as the interaction is unimplecular, the signal reaction is very rapid, permitting increased contents of the propersent primers used in the method of the broadent of the primer.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 70; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NXN motif) prossessing an NCH motif), a G-cleaver (cleaving RNA with a NXN motif), a closed to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. The cell and treat a parient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma (NHL), bulky low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular non-Hodgkin's lymphoma (NHL), lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell

```
CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-computed immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-computed in the Inflammatory arthropathy. The NOGO-computed in the Inflammatory arthropathy. The NOGO-computed in the Inflammatory acadimated NOGO activity of the conclained may be concacted with the level of NOGO. The treatment may further computes the use of one or more therapies. In particular, the NOGO-cargetting nucleic acid may be used to therapies. In particular, the NOGO-cargetting nucleic acid may be used to therapies. In narvous system (CNS) injury and carebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), chemotherapy-induced neuropathy, and/or other neurodegenerative disease cuasular dystrophy, and/or other neurodegenerative disease cuasular dystrophy, and/or other neurodegenerative disease construction is a hammerhead ribozyme of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; ID20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphoma; leukaemia; human immunodeficiency virus; HIV associated NHL; lymphocytic leukaemia; MCJ; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arbiropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; cerebroteapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; parkinson's disease; ataxia, Huntington's disease; ceutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.

Synthetic.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motili), a G-cleaver (cleaving RNA with an NGM with a NGM with an NGM with an NGM with an NGM with an NGM with a reach an amberzyme (cleaving RNA with an NGM with a call to reduce CD20 acidity of the cell and treat a patient having a condition associated with the level of CD20 in the presence of a divalent cation that is preferably NG<sup>2</sup>+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to cleave RNA associated NH, mantle-cell lymphoma (NLI), immunocytoma (INC), small B-cell lymphocytic lymphocytic lymphoma (NLI), immunocytoma (INC), small B-cell lymphocytic lymphocytic contacted with a cell to reduce NOGO gene in the invented and treat a patient having a condition associated with the level of therapies. In particular, the NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the NOGO. The treatment may further comprise the use of one or more contender a patient having a condition associated with the level of therapies. In particular, the NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the COGO activity of the NOGO. The treatment may further comprise the use of one or more companies. All and treat a patient having a condition associated with the level of therapies. In particular, the NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the COGO activity of the

```
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGO2). The regulates expression of a neurite growth inhibitor gene (NGO2). The collain and in nozyme (an endolytic nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a contacted may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a nucleic acids and preserved the noil of the preserved of CD20-targetting nucleic acid is used to cleave RNA with a YGY mortif). The CD20-targetting nucleic acid is used to cleave RNA of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more contacted with the CD20 targetting nucleic acid may be used to the call and treat (NRL), bulky low-grade or follicular non-thodakin's lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-thodakin's lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-thodakin's lymphoma (MRL), immunodeficiency virus) associated MHL mantle-cell lymphoma (MCD), immunodeficiency virus) associated MHL mantle-cell cargetting nucleic acid may be contacted with a cell to reduce NOGO gene in the cargetting nucleic acid may be contacted with a cell to reduce NOGO gene in the contacted with a cell to reduce NOGO gene in the contacted with a cell to reduce NOGO gene in the contacted with a cell to reduce NOGO gene in the contacted with a cell to reduce NOGO gene in the contacted with a cell to reduce NOGO gene in the contacted with a cell to reduce NOGO gene in the contacted with a cell to reduce NOGO gene in the contacted with a cell to reduce NOGO gene in the contacted with a cell to reduce NOGO gene in the contacted with a cell and treat a patient having a condition associated with the level of the contacted with a cell and divalent adisable. WPI; 2001-607195/69.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 131; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule CG possessing an NCH mocif,), a C-leaver (cleaving RNA with a NGN withen) RNA with a NGN triplet), a zinzyme (cleaving RNA with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD2 or treatment may further comprise the use of one or more cherapies. In particular, the CD20 targetting nucleic acid may be used to cloilicular NHI, lymphocytic cleaksemia, HIV (human immunodeficiency virus) associated NHI, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, confine a second and the NGO gene in the creatment may be contacted with a cell to reduce CD3 gene in the collacted a patient having a condition associated with the level of the NGO. The treatment may further comprise the use of one or more

nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for carperssing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as character probes for surface-enhanced laser desorption ionisation, as production, and in vacatines or for replacement therapy. The production, and in vacatines or for replacement therapy. The production associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. HGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO cat fig. wipo.int/pub/published_pot_sequence

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 concleic acids can be used as probes to detect, characterise and quantify mucleic acids can be used as probes to detect, characterise and quantify concleic acids can be used as probes to detect, characterise and quantify convide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therefore the patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a closyntherapy should skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part to the printed concentration, but was obtained in electronic format directly from MIPO concentration are the present invention.
                                             New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 17 BP; 8 A; 1 C; 8 G; 0 T; 0 U; 0 Other;

Human, POSHL 1; SH3 domain, POSH-like signalling protein 1, oncoge Rho GTPase, signal transduction, gene expression, cancer, vaccine, gene therapy, transgenic, ss. 30-JAN-2001; 2001WO-US000663. 30-JAN-2001; 2001WO-US000664. 30-JAN-2001; 2001WO-US000665. 30-JAN-2001; 2001WO-US000666. 30-JAN-2001; 2001WO-US000667. 30-JAN-2001; 2001WO-US000669. 30-JAN-2001; 2001WO-US000669. 28-JAN-2002; 2002EP-00001165 Homo sapiens EP1239051-A2 11-SEP-2002. 

```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB8399), a sequence having 65% sequence identity to (SI), CC (SI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-encogene/oncogene product that functions as an adaptor protein that interacts with Rh0 family small GTPsses as well as communitying a specific binding partner. (I) and mucleic acids (II) for identifying a specific binding partner. (I) and mucleic acids (II) concepting (I) are useful for diagnosing, monitoring disease and treating caused by altered axpression of human POSHL1 including diagnosing and cruseful in gene therapy. (II) is useful for conservating microarrays which are useful for measuring and for surveying gene expression and creating cransgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomout of torm part of the present sequence of the present sequence did not form part of the priment by the European Patent Office
                                                                                                                                                                                                                                                                            Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL
-1, useful for treating disorders associated with decreased expression or
activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, POSHL 1, SH3 domain, POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine;

                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHI 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBB3999), a sequence having 65% sequence of 6711, (SI) having 95% deviations, especially conservative substitutions or a cids (SI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHI 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and mucleic acids (II) for identifying a specific binding partner. (I) and mucleic acids (II) caused by altered expression of human POSHI including disease and treating caused by altered expression of human POSHI including disposing and treating caused by altered expression of numerous constructing microarraps which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to be present by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                           Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine; gene therapy; transgenic; ss.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (S1, ABBB399), a sequence having 65% sequence identity to (S1), (C) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-cncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful of identifying a specific binding partner. (I) and nucleic acids (II) contidentifying a specific binding partner. (I) and nucleic acids (II) consecut in general protein of the signal transduction pathway. (II) is useful for diagnoshing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnoshing and cuseful in the development of vaccines and (II) is useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples continue specification, but is based on sequence information supplied to between by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; human leukocyte antigen; HLA; genotype; polymorphism;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ABL31374;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 644
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBB3999), a sequence having 65% sequence of 6711, (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) for identifying a specific binding partner. (I) and nucleic acids (II) caused by altered expression of human POSHL1 including disease and treating caused by altered expression of human POSHL1 including microarraps which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The creating cancel is sequence is that of a scanning oligonucleotide useful in examples of present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to berwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                    Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, POSHL 1; SH3 domain, POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABLSO12-ABLS1809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as printers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide comparibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                      Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to a novel isolated 17 mer nucleic acid sequence, option in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that they indicate to them under highly stringent conditions, or the complement of any of them, or the complement conditions, or the complement acids of the invention are useful as probes and primers for detecting, indentifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors concaining the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic, virucide, neuroprotective, nootropic, neuroleptic, gene chip, antisense, sense, tumour, cell degeneration, cancer, Alzheimer's disease, schizophrenia, protein chip, gene therapy, tumour suppression, human thkutin, ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                       This sequence represents an isolated mucleic acid sequence associated with tumour suppression or regersation, apoptocasis or virus resistence. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to disapnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tumour suppression related human fukutin oligo SEQ ID No 4836.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 2.9%; Score 12.4; DB 1; Length 17; Best Local Similarity 92.9%; Pred. diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme; dc_claaver; amberzyme; cancer; REL-A activity; breast cancer; human; lung cancer; prostate cancer; coloctal cancer; brain cancer; osophageal cancer; stomach cancer; bladder cancer; pancreatic cancer; cosphageal cancer; stomach cancer; bladder cancer; pancreatic cancer; ocervical cancer; stomach cancer; overian acancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chichosphamide; doxcubin; fluorouracall carboplatin; datrexate; cyclophosphamide; doxcubin; fluorouracall carboplatin; datrexate; reclenated arthritis; restences; crohn's disease; asthma; diabetes; rheumatoid arthritis; restences; lunguals; multiple sclerosis; schaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; seppais; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel enzymatic nucleic acid molecules which down regulates expression a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NERD), where (I) is an inozyme, Zinzwe, G-Cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treathing a parient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of advalent cation, especially MG·2+. The enzymatic and antiense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, ossophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as the control method of the color o

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRS), where (I) is an inozyme, zinzwe, g-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or milidicug resistant cancer. The method involves use of other drug cervical, esistant cancer. The method involves use of other drug chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, canid molecules are also useful for treating inflammatory disease such as acid molecules are also useful for treating inflammatory disease such as colection, gene therapy applications, ischemials, traparison injury celectrian, mis accordance in the properties of a novel paramatic constants. infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

regulates expression of a sequence encoding a subunit of muclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat configuration. The enzymatic nucleic acid molecule is adapted to treat carder and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for clearing RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, creating resistant cancer. The method involves use of other drug cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug cervical, head and neck, ovarian tanibodies REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, conditable or radiation flerapy. The enzymatic and antisense nucleic conditable or radiation therapy. The enzymatic and antisense nucleic conditable or radiation therapy. The enzymatic and antisense nucleic conditable or radiation therapy. The enzymatic and antisense nucleic conditable or radiation therapy. The enzymatic and antisense nucleic conditable or adiation therapy. The enzymatic and antisense such as reals useful for treating inflammatory disease such rejection, gene therapy applications ischemial/trepartusion injury inflammatics, restenosis, intended to central nervous system (CNS) and myocardial), glomerulonephritis, inflammatic, separation, miliammatory for the content of th

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 55; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down cregulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for deaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-t. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, corrical, head and neck, ovarian cancer, melanoma, lymphoma, glicma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal attibodies; REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, concentral nervous system (CMS) and mycardial), glomeruloned second arthritis, restenosis, asthma, Crohn's disease such as crejection, gene therappy applications, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic contral nervous system (CMS) and mycardial), glomeruloned is a novel enzymatic nucleic acid molecule

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 31; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor cappa B NPKED, where (I) is an inozyme, 2inzyme, 6-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (C) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or miltidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphande, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphande, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphande, doxorubin, fluorouracil carboplatin, adatesate, cole gemoitable or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as theumatoid arthritis, restencesis, asthma, Crohn's disease, diabetes,

cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A.

(I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MS-2+. The enzymatic and antisense mucleic acid molecules are useful for traating breast, lung, prostate, colorectal, brain, oseophageal, stoomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or themotherapy including paclitaxel, docetaxel, cisplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide doxorubin, fluorouracil carboplatin, edatrexate, cand molecules are also useful for treating inflammatory disease such a caid molecules are also useful for treating inflammatory disease, cobesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft refection, gene therapy applications, ischaemia/reperfusion injury celection, gene therapy applications, ischaemia/reperfusion injury central nervous system (CNS) and myocardial), glomerulonephritis, infinection. This sequence represents the substrate of a novel enzymatic connection desiral mervous system (SNS) and myocardial).

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor cancer and is useful for down-regulating REI-A activity in a cell, for cancer and is useful for down-regulating REI-A activity in a cell, for creating a pattent having a condition associated with the level of REI-A. (I) is useful for cleaving RNA comprising a sequence of REI-A gene, in the presence of a divalent cation, especially Mg^2+ The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or cartical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or ultidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REI-A-specific inhibitors or chemotherapy including pacificaxi, fluorouracil catopolatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil catopolatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil catopolatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil catopolatin, and antisense nucleic acid molecules are also useful for treating inflammatory disease such as repeated conformance disease, lupus, multiple sclerosis, transplant/graft cajection, gene therapy applications, ischaemia/reperfusion injury cepterial nervous system (CMS) and myocardial, glomerullonsphritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic inflection. This sequence represents the substrate of a novel enzymatic
                                                                                 Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; immunostimulant; gene therapy; vaccine; human;

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ3 is proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 1601.2 and MDZ12 is encoded at chromosome 1602.3 and MDZ12, MDZ7, MDZ7, MDZ4, MDZ7, cor in manufacturing a medicament for treating or preventing a disorder or sescoiated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are protein are useful at therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytostatic; immunostimulant; gene therapy; vaccine; human;

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 403; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7922.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15p11.2 and MD212 is encoded at chromosome 15p26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy,

or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for disgnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as theraputic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention. 888888888888888

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 478; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7922.1, MD24 is encoded at chromosome for an encoded at chromosome for in manufacturing at chromosome 15926.1. The MD27 is encoded at chromosome 15926.1. The MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder or in manufacturing a medicament for treating or preventing a disorder ansociated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11 2 and MDZ12 is encoded at chromosome 16p12 and MDZ12 is encoded at chromosome 16p2 in manufacturing a medicament for treating or preventing a disorder or associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acides and proteins are also useful for disquesting remonitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ1, or MDZ12. The nucleic acide can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 7g21.3 MDZ4, MDZ12 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15g26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, 15g26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder. Co associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosling or monitoring a disease acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12, energia gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes for detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12, energia cuseful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as

```
The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-HER2, K-Ras, H-Ras, and HIV acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, shown in NaZS9889 - ABZ62216, ABZ64944 - ABZ65531, ABZ65520 - ABZ65524, ABZ65531 - ABZ65531 - ABZ65524 + Duman
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antiennse; enzymatic nucleic acid; hammeritead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative, disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ4, MDZ4, MDZ12, MDZ12 mDZ3 is cancoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6721.2, MDZ7 is encoded at chromosome 6721.2, and MDZ12 is encoded at chromosome 1671.2 and MDZ12 is encoded at chromosome 1671.2 and MDZ12 sequences are useful in therapy, or in manifacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.

  The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and/or HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and insense states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                          Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, or inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, DNAzymes, and enzymatic nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV Genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HRV) RNA. The nucleic acid molecules include antisense and erzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, Inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, DNAzymes, are nucleic acid decoy molecules and aptemers that bind to HBV reverse transcriptuse primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV Genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression of HBV methods of the invention and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HCV increase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                        Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mcswiggen J, Morrissey D, Pavco P,
                                                                                                                                                                                                                                       HCV minus strand DNAzyme substrate sequence #801
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; Page 289; 387pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as grobes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                    Cytostatic; virucide; neuroprotective; noctropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                     Murine oligonucleotide associated with tumour supression, SEQ ID 5492.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as probes and primers for detecting, identifying are quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip, in virto as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                        Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Murine oligonucleotide associated with tumour supression, SEQ ID 398.
                                                                                                                  Murine oligonucleotide associated with tumour supression, SEQ ID 2585
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, gene chip) in vitro as antifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or call degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic, antiviral, neuroprotective, nootropic, neuroleptic, ss;
primer, probe, tumour suppression, tumour reversion, apoptosis,
virus resistance, transgenic animals, Alzheimer's disease; schizophrenia;
New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                     specifically cancer but also Alzheimer's disease and schizophrenia

fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisenes sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing the mand cells containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzhelmer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for disapnosis and/or prognosis of these diseases. The nucleotides and polypeptides can and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules.
New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                          Disclosure; Page 486; 771pp; French

New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related

polypeptide and antibodies.

Disclosure; Page 682; 771pp; French.

The invention relates to the isolation of 6327 mucleotide sequences, fragments of at least 15 consecutive mucleotides of these mucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridises under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the mucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour sequencesion or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as recombinant polypeptides, and to prepare transgenic animals, as recombinant models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antiboddes (Ab) against the polypeptide are useful for prevention and/or treatment of tumours or call degeneration (e.g. Alzheimer's disease or schizophrenial). Analysis of the expression of the nucleotides can be used for diagnosis and be used to screen for their appearative molecules, and polypeptides can also be useful for treating diseases associated with abnormal expression of the nucleotides

Identifying class I or II Human Leukocyte Antigen genotypes using hybridization and amplification assays.

Claim 7; SEQ ID NO 79; 66pp; English.

The invention relates to a method of identifying a class I or II Human Leukocyre Antigen (HLA) genotype of a subject using hybridisation and amplification assay. The method is used for determining the HLA genotype

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This oligonuclectide was used in an example of synthesis of 3'- acridine-tailed oligonuclectide from acridine-CPG. Blockage of the 3' terminal phosphodiester bond improves resistance to nucleases in serum-contg. media. The new synthesis method avoids the derivatisation step of prior art methods and the possible loss and difficult separation. See AAQ22411-Q22415
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Solid support synthesis of 3'-tailedoligo-nucleotide(s) via linker gp. provides nuclease resistant prods. opt. with intercalation to improve anti-sense bonding to DNA or RNA strand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                              Gaps
of a subject. The present sequence represents a HLA class I allele specific primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies, AA231891 to AA234318, and AAY41685 to AAX41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New secreted and transmembrane polypeptides and their polynucleotides, useful for treating blood coagulation disorders, cancers and cellular adhesion disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Antisense oligonucleotides, useful for inhibiting human Ship-2 expression and for detecting nucleic acids encoding Ship-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes phosphorothioate antisense cligonucleotides that specifically hybridise with, and inhibit the expression of, nucleic acids encoding human Ship-2 (also called SH2-containing phosphatidylinosited phosphatase-2). Also described is a method of inhibiting the expression of Ship-2 in human cells or tissues in vitro comprising contacting the cells with the phosphorothioate antisense oligonuclectides. The phosphorothioate antisense oligonuclectides. The phosphorothioate antisense oligonuclectides to be used to treat animals (especially humans) suspected of having or being prone to a disease or condition associated with Ship-2 expression. The present sequence represents a phosphorothioate antisense oligonucleotide for human Ship-2, from the
                                                                   Human, Ship-2; antisense oligonucleotide; phosphorothioate; detection; inhibition; SH2-containing phosphatidylinositol phosphatase-2; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Invention, which contains a polymorphic base at position 24 of their nucleotide sequences. AAX68579 to AAX7740 represent amplification primers for the biallelic markers of the biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the invention man are one, and in complex association studies and haplotyphag studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical as of the analysis of the disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3055, 3096, 3157, 3227, 3297 and and also are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                Novel biallelic markers used to construct a high density disequilibrium

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention continue sequences in complex association studies and haplotyping studies which are useful in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions of the targets for the development of pharmaceutical efficacions tresponses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

The present invention describes a method for distinguishing a human leukocyte antigen (HLA) class I antigen or allele by a combination of polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B or -C alleles can be amplified or using reverse hybridisation analysis comprising a DNA probe covalently bonded to microtitre plate wells which are hybridisable specifically with the base sequence of at least one specific HLA-A, -B or -C allele. The method is applicable in gene typing, judging donor-recipient compatibility during organ transplant and correlation analysis for diagnosis of various diseases. The method is simple, rapid and accurate, with possibility of mechanisation and automation, without the problems encountered by using the prior-art techniques. AAAA66943 to AAAA6707 represent oligonucleotide probes and PCR primers for use in the method of the present invention
                                                                                  Simple, rapid and accurate method for distinguishing HLA class I allele type with possibility of mechanization and automation, applicable in judging donor-recipient compatibility during organ transplant and disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Genetic clustering by distributing members into optimal numbers of clusters determined by a hierarchical clustering algorithm or by pairedpair analysis of homozygous pairs in clusters got from non-hierarchical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cluster; hierarchical clustering algorithm; population based study; clinical trial; DNA fingerprint; genetic profile analysis; PCR primer; SNP; single nucleotide polymorphism; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sample member clustering methed related human DNA PCR primer #28.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2.9%; Score 12.4; DB 1; Length 18; 92.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells for specific targeting biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78670 to AAC78897 represent PCR primers and probes used in the isolation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention relates to a method of determining polynucleotide expression, which comprises hybridising digested cDNA to a capture probe coupled to a solid particle under stringent conditions, where the capture probe is specific for the target polynucleotide and the particle identifies the capture probe. The method is useful for expression profiling, where the presence and/or the amount of a target condition, disorder, or predisposition associated with a change in expression patterns, in determining the developmental or physiological state of a cell or tissue, for detecting SNPs, which may be used to screen individuals for a genetic predisposition to a disease, condition, or disorder, and in marker assisted selection. The present sequence is a hybridisation tag described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining polynucleotide expression, useful for expressing profiling or detecting single nucleotide polymorphisms, comprises hybridizing digested cDNA, to a capture probe coupled to a solid particle under stringent
                             sample, involving applying a hierarchical clustering algorithm to the sample members, determining the optimal number of clusters based on this and distributing the sample members into clusters using non-hierarchical clustering. The methods are useful in population based studies such as clinical trials, DNA fingerprinting and genetic profile analyses. The present sequence was used to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid analysis, microarray, single nucleotide polymorphism, SNP, multiplex; expression analysis; hybridisation tag; ss.

The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid maligranoites, other discorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrochagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                treating
                                                                                                                                                                                                                                          Human, PRO; benign tumour, malignant tumour; lymphoid malignancy; leukaemia, neuronal disorder; stromal disorder; blastocoelic disorder; inflammatory disorder; immune disorder; angiogenic disorder; cytostatic; neuroprotective; PCR; primer; ss.

The present invention describes a method for determining if an individual has a tumour cell or site of angiogenesis, or if a treatment is effective in changing angiogenesis or changing of a set of target cells, comprising determining if a sample of the subject has an expression product of at least one marker gene. Also described is a compound capable of siglec in a cell. Peripheral blood monouclear cell (PBMC) expressed or Siglec in a cell. Peripheral blood monouclear cell (PBMC) expressed the present invention can be used in a diagnostic method, particularly as an indicator of angiogenesis or to determine presence of a tumour cell. The method of the invention is suitable to determine within a few days if a certain treatment against Kaposi's Sarcoma is successful. Abg81851 to Abg82006 represent nucleotide sequence used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining presence of a tumor cell or angiogenesis, and the effectiveness of treatment, by detecting the presence of marker genes
                                                                                                                                  Gaps
sequences are also useful in gene therapy. The present sequence represents a PCR primer used in the methods of the present invention

first active agent comprising an oligonucleotide antisense to the first active agent comprising an oligonucleotide antisense to the first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genemic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antistathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antifinialmmatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconscription, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obsained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The invention describes an isolated nucleic acid (I) comprising, or which is at least 80 % sequence identity to, or the full-length coding sequence off, any of 118 300-2100 nucleotide sequences, which encodes its corresponding PRO polypeptide selected from 118 100-700 amino acid sequences, all given in the specification. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antiseanse RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, blosensors or bioreactors. Both are useful in tissue typing. This sequence represents a novel human secreted and transmembrane PRO polypeptide associated primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL;

New isolated PRO polypeptides e.g. PRO213, PRO274 and PRO300, for use as pharmaceuticals, diagnostics, biosensors and bioreactors, for identifying modulators of receptor-ligand interactions.

The invention relates to an isolated secreted and transmembrane polypeptide, designated as PRO polypeptide. The PRO polypeptide is useful in PRO polypeptide detection methods. The PRO polypeptide is useful for linking a bioactive molecule to a cell. The PRO polypeptide or an antibody against it is useful for modulating a biological activity of a cell. The PRO polypeptide is useful in industrial applications including

```
pharmaceuticals, diagnostics, biosensors and bioreactors. The PRO polypeptide is also useful as a thrombolytic agent, interferon, colory stimulating factor and other cytoropicatin, colony stimulating factor and other cytokines. The PRO polypeptide is useful for treating disease such as cancer e.g. colorectal carcinoma; apoptosis related conditions e.g. AIDS, amyotrophic lateral scleroals; inflammatory disease e.g. Alzheimer's disease, catherosclerosis; neurodegenerative disease e.g. Alzheimer's disease, Parkinson's disease; cardiovascular disease e.g. hypertension and glomerulonephritis; lung disease e.g. pulmonary hypertension and glomerulonephritis; lung disease e.g. pulmonary hypertension, bronchial asthma; gastrointestinal disorders e.g. pulmonary hypertension, bronchial companies is carcinogenesis. The present sequence represents a PRO polypeptide associated oligonucleotide of the invention. Note: The sequence data for this patent did not form part of the printed sequence at sequence. The sequence cate of the invention. Note: The sequence data for this patent did not form part of the printed sequence. The sequence cate of the process of the invention was obtained in electronic format directly from USPTO cat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô

The present invention relates to the isolation of novel human PRO CC polypeptides, and the polymuclectide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for inking biological activities of cells expressing PRO polypeptides, for modulating biological activities of cells expressing PRO polypeptides, and for for identifying agonists or antagonists. The bioactive molecule maybe a coxin, radiolabel or antibody, and causes apoptosis or death of the cell. The PRO polypeptides are useful for treating immune disorders, diabetes or hyper or hypo-insulinaemia, cardiac insufficiency, nervous system cisorders, and wound healing. The polymuclectide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene compaping, in the generation of antisense RNA and DNA, in the preparation of propagation of antisense RNA and DNA, in the preparation of an immals, for the generation of antisense RNA and DNA, in the preparation of an immals, for the generation sequence represents a PCR primer used in a min in gene therapy. The present invention. Note: The sequence data for this can esqdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, 88; PCR; secreted protein; transmembrane protein; PRO; primer; malignancy; cancer; ovarian cancer; colorectal cancer; sarcoma; leukaemia; lymphoma; inflammatory disease; necrosis; atherosclerosis; infertility; premature aging; psortiasis; inflammatory disease; renal disease; arthritis; immune-mediated alopecia; stroke; encephalitis; hepatitis; multiple sclerosis; gene therapy.

### (GETH ) GENENTECH INC.

Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL; Ferrara N, Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME; Goddard A, Goddowski PJ, Grimaldi JC, Gurney AL, Hillan KJ; Kljavin IJ, Kwo SS, Napter MA, Pan J, Paoni NF, Roy MA, Shelton Stewart TA, Tumas D, Williams PM, Wood WI;

#### WPI; 2003-341189/32.

New genes and secreted and transmembrane polypeptides (e.g. PRO337 or PRO1559), useful for treating or diagnosing e.g. cancers, atherosclerosis, infertility, stroke, encephalitis, hepatitis or multiple sclerosis in mammals.

## Example 4; Page 121; 460pp; English.

The invention relates to a new isolated nucleic acid molecule comprises a gequence with at least 80% identity to: (a) a nucleotide encoding any of 94 multiple of 94 pRO polypeptides whose sequences are fully defined in the specification; or the full length coding sequence of any these 94 mucleotide sequences. Also included are an isolated PRO polypeptide corrupts at least 80% politypeptide are an isolated PRO polypeptide having at least 80% amino acid sequence dream isolated PRO polypeptide having corring at least 80% amino acid sequence identity to: (a) an amino acid sequence corrupts at least 80% amino acid sequence identity to: (a) an amino acid sequence corrupts at least 80% amino acid sequence identity to: (a) an amino acid sequence corrupts associated signal specification; (b) the PRO polypeptide, lacking its associated signal peptide, avector comprising the nucleic peptide; or (c) an extracellular domain of the PRO polypeptide, with or lacking its associated signal peptide), a vector comprising the nucleic peptide; or (a) a chimaeric molecule comprising the vector (and polypeptide fused corrupts and an anin-PRO acid sequence and an anti-PRO acid sequence or polypeptides are useful as pharmaceuticals, inclammatory disease, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating e.g. malignancies or cancers (e.g. ovarian cancer, colorectal cancer, sarcoma, leuksemia or lymphoma), inflammatory disease, infertility, premature adjing, psoriasis, infertility, premature adjing, psoriasis, infertility, premature, adjing, psoriasis, infertility, premature, adjing, psoriasis, infertility, are propappides are useful as molecular weight markers, or for chromosome corrupts, and these diseases. The PRO polypeptides are useful as molecular weight markers, or for chromosome calso useful as molecular weight markers, or for chromosome calso useful as molecular weight markers, or for chromosome calso the present sequence is a per per infer energy, particularly for replacing a propoly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ľ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated PRO polypeptides for example extracellular, secreted and membrane bound proteins, useful for modulating the biological activities of cells and for treating, for example diabetes, cancer, rheumatoid arthritis, and hearing loss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes an isolated secreted and transmembrane (PRO) polypeptide (I). PRO317 polypeptide is useful for detecting PRO4993 polypeptide in a sample, and vice versa. PRO725, PRO700 and PRO739 are useful for detecting PRO725, PRO700 and PRO739 in a sample, and PRO1559 is useful for detecting PRO725, PRO700 and PRO739 in a sample, PRO4993 is polypeptide, and PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO337 polypeptide, PRO705 is useful for linking a bioactive molecule to a cell expressing a PRO337 polypeptide, PRO705, PRO700 and PRO739 polypeptide, PRO705, PRO700 and PRO739 polypeptide, and PRO735, PRO700 and PRO739 polypeptide, and PRO735, PRO700 and PRO739
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Shelton
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    KP, Botstein D, Desnoyers L, Eaton DL;

```
The invention describes an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide (I). (I) is useful for detecting PRO4993, PRO329, PRO725, PRO700 or PRO739 polypeptide, and for linking a bioactive molecule to a cell expressing the above polypeptides. The bioactive molecule is a toxin, radiolabel or an antibody and causes cell death. (I) is useful as therapeutic agent, in medical and industrial applications e.g. for treating neuropathy, especially peripheral neuropathy, dispecially peripheral neuropathy, discassociated neuropathy, charcot-Marie-Tooth disease, Refusum's disease, Abetalipoproteinaemia, Tangier disease, Krabbe's disease, Metachromatic leukodystrophy, Pabry's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL;

The present invention relates to the isolation of novel human PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking bioactive molecules to cells expressing PRO polypeptides, for modulating biological activities of cells expressing PRO polypeptides, and for toxin, radiolabel or antibody, and cause cell death. The PRO polypeptides are useful for treating neuropathy and neuropathy related diseases such as Charcher-Marie-Tooth disorder, Refoun's diseases, and Krabbe's disease. The polynucleotide sequences encoding PRO polypeptides are useful as The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, 88; PCR, secreted protein, transmembrane protein, PRO; cytostatic, ophthalmological, antiarthritic, osteopathic, antirheumatic, vulnerary, auditory, tumour growth, retinal disorder; sports-related joint problem, articular cartilage defects, osteoarthritis, rheumatoid arthritis; wound healing, hearing loss; primer.
                                                                                       New PRO polypeptides useful for treating peripheral neuropathy, neuropathies associated with systemic disease such as post-polio syndrome or AIDS-associated syndrome.
